1. xyz is a media company which makes gaming related videos- video game reviews, trailer reviews, news related to the latest video games, and e-sports tournaments. They have a very repetitive, and time consuming workflow which can easily be automated. Their goal is simple: maximize views while reducing the time spent on producing each video. Additionally, they would like to expand to different forms of media and would like to have a better way of managing their employees/freelancers.
Your task: Create a dashboard for them to manage the video projects, and automate their tasks.

2. Teens are passionate about fashion but often find it difficult to build outfits from their existing wardrobe or keep up with trends without spending too much. They want a smart, fun, and easy-to-use tool that can help them plan outfits, mix and match items, and discover new styles without the need for a personal stylist or large budget.
Your task: Create an AI-powered fashion assistant that helps teens plan outfits, organize their wardrobe, and discover new trends. The app should make it easy for users to visualize their clothing items, get outfit suggestions, and shop smart based on their preferences. The assistant should act as a virtual fashion guide, helping users curate stylish and unique outfits, while also considering their personal tastes, current trends, and occasions.
